Highlights of Women's Earnings in 2001

Abstract

[Excerpt] This report presents earnings data from the Current Population Survey (CPS). The CPS is a national monthly survey of approximately 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics. The earnings data are collected from one-fourth of the CPS monthly sample. Users should note that the comparisons by sex in this report are on a broad level and do not control for many factors that can be significant in explaining earnings differences. For a detailed description of the source of the data and an explanation of the concepts and definitions used, please see the Technical Note included at the end of this report.

Keywords

women, gender, earnings, employment, income inequality, gender gap

Highlights of Women's Earnings in 2001

U.S. Department of Labor
Bureau of Labor Statistics
May 2002
Report 960

NOTE: The statistics in this report for the years 2000 and 2001 were revised after this report was published.

These data were revised in 2003 to incorporate Census 2000-based population controls and other changes to the survey, but the report was not reissued.

To obtain revised data for these years, contact the Division of Labor Force Statistics by email at cpsinfo@bls.gov or by telephone at (202) 691-6378.

Highlights of Women's Earnings in 2001

U.S. Department of Labor
Bureau of Labor Statistics
May 2002

Report 960

Introduction

In 2001, median weekly earnings for women who were full-time wage and salary workers were \$511, or 76 percent of the \$672 median for their male counterparts. The male-female earnings ratio was about the same as it was in 2000. In 1979, the first year of comparable earnings data, women earned 63 percent as much as men. (See chart 1.)

The women's-to-men's earnings ratio varies significantly by demographic group. Among blacks and Hispanics, for example, the ratios were about 87 and 88 percent, respectively, in 2001; for whites, the ratio was about 75 percent. Young women and men (those 16 to 24 years old) had fairly similar earnings; however, in the older age groups, women's earnings were much lower than men's.

This report presents earnings data from the Current Population Survey (CPS). The CPS is a national monthly survey of approximately 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics. The earnings data are collected from one-fourth of the CPS monthly sample. Users should note that the comparisons by sex in this report are on a broad level and do not control for many factors that can be significant in explaining earnings differences. For a detailed description of the source of the data and an explanation of the concepts and definitions used, please see the Technical Note included at the end of this report.

Highlights

Following are some highlights of women's and men's earnings in 2001:

Full-time workers

- Among women, 45- to 54-year-olds had the highest earnings (\$588), followed by 35- to 44-year-olds (\$545), as has been the case in recent years. Men's earnings also peaked among 45- to 54-year-olds (\$799). The difference between women's and men's earnings is greater among middle-aged and older workers than it is among younger workers. For example, among workers aged 45 to 54, women earned 73.6 percent as much as men did; in contrast, women aged 16 to 24 earned 90.2 percent as much as their male counterparts. (See tables 1, 8, and 13.)

- Between 1979 and 2001, the earnings gap between women and men narrowed for most major age groups. The women's-to-men's earnings ratio among 35- to 44-year-olds, for example, was 72.3 percent in 2001 compared with 58.3 percent in 1979, and that for 45- to 54-year-olds was 73.6 percent compared with 56.9 percent. The earnings ratios for teenagers and for workers aged 65 and over, however, showed no consistent movement over the period. (See table 13.)

- White workers of either gender earned more than their black or Hispanic counterparts, although the differences among women were much smaller than those among men. White women's earnings (\$521) were 15.5 percent higher than black women's (\$451), and 35.3 percent higher than those of Hispanic women (\$385). In contrast, white men's earnings (\$694) were 34 percent higher than the earnings of their black counterparts (\$518) and 58.4 percent greater than those of Hispanic men (\$438). Since 1979, earnings growth of white women and men has outpaced that of blacks and Hispanics. (See tables 1 and 14.)

- The earnings difference between women and men continued to be widest for whites. White women earned just 75.2 percent as much as white men in 2001. Black women's earnings were 87.1 percent of black men's, and Hispanic women made 88.0 percent as much as Hispanic men. (See table 1 and chart 2.)

- Between 1979 and 2001, inflation-adjusted earnings for white women grew fairly steadily, rising by 24.6 percent. Earnings growth over the period among black women was much less, at 17.4 percent, and Hispanic women's earnings rose just 7.8 percent. In contrast, real earnings for white men rose only 2.4 percent, earnings for black men were unchanged, and those for Hispanic men fell. (See table 14.)

- Median weekly earnings varied considerably by educational level. Among women, those with less than a high school diploma earned \$314 per week, compared with \$784 for those with a college degree. Among men, high school dropouts had earnings of \$415 a week, compared with \$1,082 for college graduates. (See table 7.)

- At all levels of education, women have fared better over time with respect to earnings growth than have men. Although both women and men with less than a high school diploma have experienced a decline in inflation-adjusted earnings since 1979, women's earnings have fallen significantly less—9.0 percent, compared with a 27.6-percent drop for men. Earnings for women with college degrees have increased by 30.9 percent since 1979 on an inflation-adjusted basis, while those of male college graduates have risen by 20.2 percent. (See table 15 and chart 3.)

- Women working full time in professional specialty occupations earned \$749 per week in 2001. This was more than women earned in any other major occupational category. Within the professional specialty occupations, women working as engineers, computer scientists, physicians, pharmacists, and lawyers had the highest median weekly earnings. (See tables 2 and 3.)

- Women's share of employment in occupations typified by high earnings has grown. In 2001, 47.1 percent of full-time wage and salary workers in executive, administrative, and managerial occupations were women, up from 34.2 percent in 1983 (the first year for which comparable data are available). Over the same period, women's share of full-time employment in professional specialty occupations rose from 46.8 percent to 51.8 percent. (See table 2.)

- Despite increased representation in the higher paying managerial and professional occupations, women remained a small proportion of other relatively high-paying occupations such as protective service and precision production, craft, and repair. Men were about 9 times as likely as women to be employed in precision production, craft, and repair occupations and nearly 4 times more likely to be in protective service occupations. (See tables 2 and 3.)

- In both the managerial and professional occupational categories, women and men tended to work in different specific occupations. Although professional specialty occupations were the highest paid for women, men were much more likely to be employed in the highest paying professions, such as engineers and mathematical and computer scientists. In contrast, women were more likely to work in lower paying professional occupations, such as teachers (except college and university). (See table 3.)

- The ratio of female-to-male earnings varied by State, from a high of 88.5 percent in the District of Columbia to a low of 67.4 percent in Wyoming. The differences among the States reflect, in part, variations in the occupation, industry, and age composition of State labor forces. In addition, sampling error for the State estimates is considerably larger than it is for the national data. (See table 4.)

Part-time workers

- Women who worked part time—that is, less than 35 hours per week—accounted for 24.6 percent of all female wage and salary workers in 2001. In contrast, just 10.6 percent of men in wage and salary jobs worked part time. (See tables 5 and 6.)

- Median weekly earnings of female part-time workers were \$186, or 36.4 percent of the median for women who worked full time. The earnings of male part-time workers (\$168) were somewhat lower than those of female part-timers. This is largely because, unlike women, male part-time workers are highly concentrated in the youngest age groups, which typically have low earnings. In 2001, about 54 percent of male part-time workers were 16 to 24 years old, compared with 32 percent of female part-timers. (See table 5.)

Workers paid by the hour

- About 63 percent of women and 57 percent of men employed in wage and salary jobs were paid by the hour in 2001. Women who were hourly paid workers had median hourly earnings of \$9.57. This was 84.3 percent of the median for men paid by the hour (\$11.36). (See tables 10, 11, 16, and 17.)

- About 4 percent of women who were paid hourly rates in 2001 reported hourly earnings at or below the prevailing Federal minimum wage of \$5.15. This compares with approximately 2 percent of men who were paid by the hour. (See tables 12, 18, and chart 4. Also see the Technical Note for information about workers with earnings below the Federal minimum wage.)

- As would be expected, 16- to 19-year-old women and men who were hourly paid workers were the most likely to have earnings at or below the minimum wage. Among both women and men, those aged 45 to 54 were the least likely to earn the minimum wage or less. (See table 12.)

Chart 1. Median usual weekly earnings of full-time wage and salary workers in constant (2001) dollars by sex, 1979-2001 annual averages

Chart 2. Median usual weekly earnings of full-time wage and salary workers by sex, race, and Hispanic origin, 2001 annual averages

Chart 3. Percent change from 1979 to 2001 in median usual weekly earnings by educational attainment and sex

NOTE: Data relate to full-time wage and salary workers 25 years and over. Changes are calculated from constant-dollar annual averages.

Chart 4. Percent of women with earnings at or below the Federal minimum wage by age, 2001 annual averages

NOTE: Data relate to female wage and salary workers paid hourly rates.

Some college or associate degree	24,764	621	2	11,618	525	3	13,146	725	3	72.4
College graduates, total	27,783	924	3	12,151	784	4	15,632	1082	8	72.5

¹ These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table.

² Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of male and female employees by occupation, industry, firm size, or geographic region.

³ Data refer to members of a labor union or an employee association similar

to a union.

⁴ Data refer to members of a labor union or an employee association similar to a union as well as workers who report no union affiliation but whose jobs are covered by a union or an employee association contract.

NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

25 to 29 hours	2,462	217	2	1,688	220	2	774	210	3	104.6
30 to 34 hours	4,720	276	2	3,342	280	3	1,377	269	3	104.4
35 hours and over	94,149	598	1	41,650	514	1	52,499	674	2	76.3
35 to 39 hours	6,964	409	3	4,911	408	3	2,053	413	7	98.6
40 hours	65,618	542	2	30,352	495	1	35,266	600	2	82.5
41 hours and over	21,567	878	4	6,387	772	5	15,180	929	5	83.1
41 to 44 hours	1,449	657	10	617	598	10	832	707	15	84.7
45 to 48 hours	6,327	779	7	2,216	739	6	4,111	818	9	90.3
49 to 59 hours	9,459	952	5	2,629	864	8	6,831	988	8	87.5
60 hours and over	4,332	1,002	10	926	830	19	3,406	1,060	19	78.3
Hours vary	8,086	385	4	3,635	271	4	4,451	522	10	51.9
Usually less than 35 hours	2,400	150	2	1,510	150	3	890	152	4	98.5
Usually 35 hours or more	5,450	570	9	2,021	412	7	3,429	646	9	63.8

¹ These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table.

NOTE: Data refer to the sole or principal job of full- and part-time workers.

Detail for the above "hours vary" groups will not sum to totals because data are not presented for a small number of multiple jobholders whose usual number of hours on the principal job is not identifiable.

Table 7. Quartiles and selected deciles of usual weekly earnings of full-time wage and salary workers by selected characteristics, 2001 annual averages

Characteristic	Number of workers (in thousands)	Upper limit of:				
		First decile	First quartile	Second quartile (median)	Third quartile	Ninth decile
SEX, RACE, AND HISPANIC ORIGIN						
Total, 16 years and over	99,599	\$290	\$396	\$597	\$898	\$1,346
Women	43,671	270	356	511	750	1,073

¹ These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table.

² Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of male and female employees by occupation, industry, firm size, or geographic region.

³ Data refer to members of a labor union or an employee association similar

to a union.

⁴ Data refer to members of a labor union or an employee association similar to a union as well as workers who report no union affiliation but whose jobs are covered by a union or an employee association contract.

NOTE: Hourly-paid workers account for approximately three-fifths of all wage and salary workers. Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 11. Hourly earnings distribution of wage and salary workers paid hourly rates by selected characteristics, 2001 annual averages

(In thousands)

Characteristic	Total employed	Hourly earnings distribution								
		Under \$4.00	\$4.00 to \$4.99	\$5.00 to \$5.99	\$6.00 to \$7.99	\$8.00 to \$9.99	\$10.00 to \$11.99	\$12.00 to \$15.99	\$16.00 to \$19.99	\$20.00 or more

Full-time workers					
Women	55,232	662	191	853	1.5
Men	24,780	413	112	525	2.1
Part-time workers	30,452	249	79	328	1.1
Women	17,124	937	441	1,378	8.0
Men	11,613	657	266	923	7.9
	5,511	279	176	455	8.3

¹ The distinction between full- and part-time workers is based on hours usually worked. These data will not sum to totals because full- or part-time status on the principal job is not identifiable for a small number of multiple jobholders.

NOTE: Detail for the above race and Hispanic-origin groups will not

sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups. See Technical Note for more information about minimum wage workers.

¹ The comparability of historical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Explanatory Notes and Estimates of Error section of *Employment and Earnings*, a monthly BLS periodical.

² Data for 1990-91 and 1996-97 reflect changes in the minimum wage

that took place in those years.

NOTE: The prevailing Federal minimum wage was \$2.90 in 1979, \$3.10 in 1980, and \$3.35 in 1981-89. The minimum wage rose to \$3.80 in April 1990, to \$4.25 in April 1991, to \$4.75 in October 1996, and to \$5.15 in September 1997. See Technical Note for more information about minimum wage workers.

Technical Note

The estimates in this report were obtained from the Current Population Survey (CPS), which provides a wide range of information on the labor force, employment, and unemployment. The survey is conducted monthly for the Bureau of Labor Statistics (BLS) by the U.S. Census Bureau using a scientifically selected national sample of about 60,000 households, with coverage in all 50 States and the District of Columbia. The earnings data are collected from one-fourth of the CPS monthly sample.

Material in this report is in the public domain and, with appropriate credit, may be used without permission. This information is available to sensory impaired individuals upon request. Voice phone: (202) 691-5200; Federal Relay Service: 1-800-877-8339.

Concepts and definitions

The principal concepts and definitions used in connection with the earnings data in this report are described below.

Usual weekly earnings. Data are collected on wages and salaries before taxes and other deductions, and include any overtime pay, commissions, or tips usually received (at the principal job in the case of multiple jobholders). Self-employed workers are excluded, regardless of whether their businesses are incorporated. Prior to 1994, respondents were asked how much they usually earned per week. Since January 1994, respondents have been asked to identify the easiest way for them to report earnings (hourly, weekly, biweekly, twice monthly, monthly, annually, other) and how much they usually earn in the reported period. Earnings reported on a basis other than weekly are converted to a weekly equivalent. The term “usual” is as perceived by the respondent. If the respondent asks for a definition of usual, interviewers are instructed to define the term as more than half the weeks worked during the past 4 or 5 months.

Medians (and quantiles) of weekly earnings. The median (or upper limit of the second quartile) is the amount that divides a given earnings distribution into two equal groups, one having earnings above the median, and the other having earnings below the median. Ten percent of a given distribution have earnings below the upper limit of the first decile (90 percent have higher earnings); 25 percent have earnings below the upper limit of the first quartile (75 percent have higher earnings); 75 percent have earnings below the upper limit of the third quartile (25 percent have higher earnings); and 90 percent have earnings below the upper limit of the ninth decile (10 percent have higher earnings).

The BLS estimating procedure for determining the median of an earnings distribution places each reported or calculated weekly earnings value into a \$50-wide interval that is centered around a multiple of \$50. The actual value of the

median is estimated through the linear interpolation of the interval in which the median lies.

Over-the-year changes in the medians (and quantile boundaries) for specific groups may not necessarily be consistent with the movements estimated for the overall quantile boundary. The most common reasons for this possible anomaly are: (1) There could be a change in the relative weights of the subgroups. For example, the medians of both 16- to 24-year-olds and those 25 years and over may rise, but if the lower earning 16-to-24 age group accounts for a greatly increased share of the total, the overall median could actually fall. (2) There could be a large change in the shape of the distribution of reported earnings, particularly near a quantile boundary. This could be caused by survey observations that are clustered at rounded values, for example, \$250, \$300, or \$400. An estimate lying in a \$50-wide centered interval containing such a cluster, or “spike,” tends to change more slowly than one in other intervals. For example, medians measure the central tendency of a multi-peaked distribution that shifts over time. As the distribution shifts, the median does not necessarily move at the same rate. Specifically, the median takes relatively more time to move through a frequently reported interval but, once above the upper limit of such an interval, it can move relatively quickly to the next frequently reported earnings interval. BLS procedures for estimating medians (and other quantile boundaries) mitigate such irregular movements of the measures; however, users should be cautious of these effects when evaluating short-term changes in the medians, as well as in ratios of the medians.

Constant dollars. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. BLS has made numerous improvements to the Consumer Price Index (CPI) over the past quarter-century. While these improvements make the present and future CPI more accurate, historical price index series are not adjusted to reflect the improvements. However, many researchers have expressed interest in having a historical series that measures price change consistently over the entire period. Accordingly, the CPI-U-RS presents an estimate of the CPI that incorporates most of the methodological improvements made since 1978 into the entire series. For further information, see “CPI research series using current methods, 1978-98” by Kenneth J. Stewart and Stephen B. Reed, *Monthly Labor Review*, June 1999, pp. 29-38; and “Questions and Answers: Consumer Price Index Research Series Using Current Methods” on the Internet at <http://www.bls.gov/cpi/cpirsdc.htm>.

Wage and salary workers. These are workers who receive wages, salaries, commissions, tips, payment in kind, or piece rates. The group includes employees in both the private and

public sectors but, for purposes of the earnings series, excludes all self-employed persons, regardless of whether their businesses are incorporated.

Full-time workers. Workers who usually work 35 hours or more per week at their sole or principal job are defined as working full time for estimates of earnings.

Part-time workers. Workers who usually work less than 35 hours per week at their sole or principal job are defined as working part time for estimates of earnings.

Hourly paid workers. Workers who are paid an hourly wage are a subset of wage and salary workers, representing approximately three-fifths of all wage and salary workers. Workers paid by the hour are, therefore, included in the full- and part-time worker tables in this report, along with salaried workers and other workers not paid by the hour. (Data for workers paid at hourly rates are presented separately in tables 10 to 12 and 16 to 18.)

Workers paid at or below the Federal minimum wage. The estimates of the numbers of workers with reported earnings at or below the Federal minimum wage in tables 12 and 18 pertain only to workers who are paid hourly rates. Salaried workers and other workers who are not paid by the hour are not included, even though some have earnings that, when converted to hourly rates, are at or below the minimum wage. Consequently, the estimates presented in this report likely understate the actual number of workers with hourly earnings at or below the minimum wage. Research has shown, however, that the degree of understatement is small. BLS does not routinely estimate hourly earnings for workers not paid by the hour because of data quality concerns associated with such an estimation process.

The prevailing Federal minimum wage was: \$2.90 effective January 1979; \$3.10 effective January 1980; \$3.35 effective January 1981; \$3.80 effective April 1990; \$4.25 effective April 1991; \$4.75 effective October 1996; and \$5.15 effective September 1997. Data for 1990-91 and 1996-97 in table 18

reflect changes in the minimum wage that took place during those years.

The presence of workers with hourly earnings below the minimum wage does not necessarily indicate violations of the Fair Labor Standards Act, as there are exemptions to the minimum wage provisions of the law. In addition, some workers might have rounded their hourly earnings to the nearest dollar in response to survey questions. As a result, some might have been reported with hourly earnings below the minimum wage when, in fact, they earned the minimum wage or higher. This may be more likely to occur in years during which the minimum wage level is just above a whole dollar value, as has been the case since September 1997 (\$5.15).

Reliability

Statistics based on the CPS are subject to both sampling and nonsampling error. When a sample, rather than an entire population, is surveyed, there is a chance that the sample estimates may differ from the “true” population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the “true” population value because of sampling error. BLS analyses generally are conducted at the 90-percent level of confidence. Estimates of earnings and their standard errors can be used to construct approximate confidence intervals, or ranges of values that include the true population value with known probabilities.

The CPS data also are affected by nonsampling error. Nonsampling error can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information, and errors made in the collection or processing of the data.

For a full discussion of the reliability of data from the CPS and information on estimating standard errors, see the “Explanatory Notes and Estimates of Error” section of *Employment and Earnings*.
